Transforming lives in Africa through research.

Modelling the impact of educational campaigns and spousal involvement on women's fertility preferences and pregnancy outcomes

Evans Omondi

### Outline

Transforming lives in Africa through research

## Background

- Family planning initiatives: Kenya has implemented several key policies to improve health and well-being.
- **Disparities:** Significant disparities in maternal and child health outcomes persist.
- **Campaigns:** Educational campaigns about fertility preferences and contraceptive use are critical.
- Male inclusion: Male involvement in fertility preferences and contraceptive use is critical for effective policy development.
- **ABM:** Application of ABM in exploring complex dynamics
- **Drivers:** All women of reproductive age (15-49)
- Subject: A crucial consideration for government and policymakers

### **Objectives**

- To examine the existing family planning simulator by O'Brien et.al., (2023) and develop a FPSim-NUHDSS motivated by local data.
- Assess the impact of educational campaigns and involvement on fertility preferences, contraceptive use, and pregnancy outcomes
- Guide the development of targeted policies and interventions for family planning.
- Patterns and trends in births, deaths (infant and maternal), and overall family planning dynamics in Urban slums of Nairobi.

male

### Data sources

- **NUHDSS:** Gives insights into demographic events within the urban slums
- Locations: Korogocho and Viwandani urban slums in Nairobi
- Data collection: Longitudinal observational study
- Variables: Social demographic characteristics,
  reproductive history and preferences, family planning
  knowledge and use, pregnancy outcomes, etc.
  Time: Data collected from 2012 2015
- Population studied: 756 individuals

### Interventions

#### Male involvement

- Family planning discussions
- Decision making
- Fertility preferences

# Male involvement & campaigns

Combination of 2 interventions

• •

#### Campaigns

- Health promotions
- Responsible parenthood
- Birth spacing benefits

#### Intervention effectiveness

- Effect size
- Women's awareness
- Women preferences

Campaign coverage above 60% showed no impact in the contraceptive use, maternal and infant mortality

With a campaign coverage of 60%, the number of infant deaths is slightly reduced

Majority of women aged between 15-19 and 20-34 are switching to no use of modern contraceptive

Women aged 35 and above show mixed switching habits: Some opting to no use, some moving from short-term to modern (long-term), majority maintaining

Slight change in CPR with campaigns

Young women (15-19) used other methods but switching to none as majority

High fluctuations in maternal mortality and infant

## Conclusions

- This work is made possible by longitudinal survey conducted through NUHDSS
- There is reasonably high use of various contraceptive methods among women in the urban slums.
- Campaigns about fertility preferences improves the family planning outcomes in the urban slums of Nairobi.
- Women in the adolescent age prefer using none of the contraceptive methods with some using the short-term contraceptive methods like condoms.
- The analysis is essential for identifying marginalized segments of the population that may face disproportionate challenges related to maternal and infant mortality.
- The insights derived from this study can inform the development of targeted interventions, facilitating the efficient allocation of resources to address the unique needs of these vulnerable groups.

### Next steps

![](_page_16_Picture_1.jpeg)

- Implement the implications spouse involvement in decision making processes.
- Perform the experimental analysis and make the comparison between the data and the model output.
- Check the implications of health facilities to the maternal health and fertility preferences.
- Leverage spatial with ABM modelling to study the impact of locations on health outcomes.
